Application of discrete delayed matrix sine and cosine to relative controllability of linear discrete systems of higher-order

J. Diblík

Brno University of Technology, Czech Republic

A problem of relative controllability described by linear discrete systems of higher-order is considered. By a formula that uses special matrix functions (discrete delayed matrix sine and cosine) to compute solution of the initial problem, a criterion is found for relative controllability. A relevant control function is constructed. The results are illustrated by examples.
